

Dear Hiring Manager,

I am excited to apply for the Data Engineer position on Google's data platform team in Munich. The role's focus on owning the ingestion and transformation layer, introducing rigorous data-quality checks, and partnering with analytics engineers aligns directly with the work that has defined my six-year career.

My strongest contribution is a relentless focus on making unreliable pipelines "boring." I built an end-to-end data pipeline that ingests messy regional rail feeds, normalizes the information, and publishes a clean, publicly available dataset on punctuality. By implementing automated validation at each stage and alerting on failures, the pipeline stopped generating nightly alarms for downstream users and now runs without manual intervention. This experience mirrors the responsibility of designing batch and streaming pipelines, orchestrating schedules, and embedding contract tests to protect downstream dashboards.

In addition to technical delivery, I have mentored two junior engineers, guiding them through the full lifecycle of data products, from raw ingestion to the dashboards used by business stakeholders. This hands-on mentorship prepared me to review peers' work and support a small, senior data team, as described in the job posting. I thrive in environments where ownership is clear and I can follow a problem from source to visualization, ensuring the solution remains reliable long after I step away.

Google's emphasis on a high-quality data platform that serves multiple product teams resonates with my desire to work where data quality is treated as a first-class concern. I am eager to bring my experience in building stable, well-monitored pipelines and my collaborative approach with operations and analytics partners to help scale the platform as usage grows.

I look forward to discussing how my background in dependable data engineering and mentorship can contribute to Google's data platform success.

Best regards,

Jane Doe
